Schedule XML Schema

The Schedule XML Schema can be used to validate the XML Pharmaceutical Schedule distributed by PHARMAC.

From [Schedule.xsd](#):

Pharmaceutical Schedule XML Schema

Copyright (c) 2002-2006 PHARMAC

This schema can be considered the authoritative Pharmaceutical Schedule XML Schema as of July 2006, see the ChangeLog annotation for revision details.

Changes to the Schedule XML Schema

The current Schedule XML Schema is available here:

<http://www.pharmac.govt.nz/2006/07/Schedule.xsd>

Revision history is kept within, near the top of the schema (xpath: //xs:appinfo/schedule:ChangeLog).

Changes will only be made to this schema that are backwards compatible with previously distributed XML Schedules released under this schema. These changes will be announced in the proofing and distribution list emails.

When a schema change is necessary that would break backwards compatibility a new schema location is made based on the date of schema change, ie:

<http://www.pharmac.govt.nz/2007/01/Schedule.xsd>

Proofing and distribution lists would be alerted of this incompatible change ahead of the first distribution released under the updated schema.

Note

These procedures are meant as a stopgap measure and do not constitute changes to existing change consultation procedure.

MathML

A subset of *MathML* is used for Special Authority form criteria, more information about *MathML* can be found at the *MathML* homepage:

<http://www.w3.org/Math/>

The MathML XML Schema is available here:

<http://www.w3.org/Math/XMLSchema/>

The following changes were made to the MathML schema to enable it to work with the [libxml2 XML C parser and toolkit](#):

```

</xs:choice>
```

Note

These changes aren't modifying the MathML schema per se, they disable certain MathML features that libxml2 considers "not determinist", and which we don't use anyway.

MathML bundles its own subset of xlink so we modify `mathml2/common/common-attribs.xsd` to refer to our one instead:

```

XHTML

We use *XHTML-1.0-Strict* for notes and guidelines, for more information see the *XHTML 1.0* homepage:

<http://www.w3.org/TR/xhtml1/>

The XML Schema `xhtml1-strict.xsd` is imported by `Schedule.xsd` from a copy in the same directory, the original is available here:

<http://www.w3.org/2002/08/xhtml/xhtml1-strict.xsd>

This schema depends on the XML Schema `xml.xsd` copied from:

<http://www.w3.org/2001/xml.xsd>

To enable the importation of the relative `xml.xsd` by `xhtml1-strict.xsd` the following change was made to `xhtml1-strict.xsd`:

```

33c33
<      schemaLocation="http://www.w3.org/2001/xml.xsd"/>
---
>      schemaLocation="xml.xsd"/>
```

We also add the following to allow xlink attributes to occur wherever and allow validation:

```

XLink

We use *XLink* attributes to reference parts of the schedule, for more information see:

<http://www.w3.org/TR/xlink/>

The XML Schema `xlink.xsd` is imported by `Schedule.xsd` from a copy in the same directory, the original was obtained from:

<http://dev.w3.org/cvsweb/~checkout~/2002/issues/schema/xlink.xsd?rev=1.2&content-type=text/plain>
