## Ocrelizumab

and	ications fr	n <b>tion — Multiple Sclerosis - ocrelizumab</b> rom any relevant practitioner. Approvals valid for 12 months. (tick boxes where appropriate)
and       Patient has had at least one significant attack of MS in the previous 12 months or two significant attacks in the past 24 months and         and       Each significant attack must be confirmed by the applying neurologist or general physician (the patient may not necessarily have been seen by them during the attack, but the neurologist/physician must be satisfied that the clinical features were characteristic)         and       Each significant attack is associated with characteristic new symptom(s)/sign(s) or substantially worsening of previously experienced symptoms(s)/sign(s)         and       Each significant attack has lasted at least one week and has started at least one month after the onset of a previous attack (where relevant)         and       Each significant attack can be distinguished from the effects of general fatigue; and is not associated with a fever (T> 37.5°C)         and       Each significant attack is a recurrent paroxysmal symptom of multiple sclerosis (tonic selzures/spasms, trigeminal neuralgia, Lhermitte's symptom)         and       Evidence of new inflammatory activity on ARI scanning (in criterion 5 immediately above) is a gadolinium enhancing lesion         or       A sign of that new inflammatory activity is a lesion showing diffusion restriction         or       A sign of that new inflammatory activity is a prominent T2 lesion that clearly is responsible for the clinical features of a recent attack that occurred within the lat 2 years         or       A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan         or       A sign of that new inflammato	a	neurologist
Patient has had at least one significant attack of MS in the previous 12 months or two significant attacks in the past 24 months     received attack must be confirmed by the applying neurologist or general physician (the patient may not     necessarily have been seen by them during the attack, but the neurologist/physician must be satisfied that the clinical     features were characteristic)     and     Each significant attack is associated with characteristic new symptom(s)/sign(s) or substantially worsening of previously     experienced symptoms(s)/sign(s)     attack (where relevant)     Each significant attack has lasted at least one week and has started at least one month after the onset of a previous     attack (where relevant)     Each significant attack can be distinguished from the effects of general fatigue; and is not associated with a fever (T>     37.5°C)     and     Each significant attack is severe enough to change either the EDSS or at least one of the Kurtze Functional     System scores by at least 1 point     or     Each significant attack is a recurrent paroxysmal symptom of multiple sclerosis (tonic seizures/spasms, trigeminal     neuralgia, Lhermitte's symptom)     and     Evidence of new inflammatory activity on an MRI scan within the past 24 months     and         A sign of that new inflammatory activity is a lesion showing diffusion restriction     or         A sign of that new inflammatory activity is a lesion showing diffusion restriction     or     A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan         A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan     or     A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan     or     A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan     or     A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan     or     A sign of that new inflam		Patient has an EDSS score between 0 – 6.0
Each significant attack must be confirmed by the applying neurologist or general physician (the patient may not necessarily have been seen by them during the attack, but the neurologist/physician must be satisfied that the clinical features were characteristic)     Each significant attack is associated with characteristic new symptom(s)/sign(s) or substantially worsening of previously experienced symptoms(s)/sign(s)     Each significant attack has lasted at least one week and has started at least one month after the onset of a previous attack (where relevant)     Each significant attack can be distinguished from the effects of general fatigue; and is not associated with a fever (T> 37.5°C)     and     Each significant attack is severe enough to change either the EDSS or at least one of the Kurtze Functional System scores by at least 1 point     or     Each significant attack is a recurrent parxysmal symptom of multiple sclerosis (tonic seizures/spasms, trigeminal neuralgia, Lhermitte's symptom)     and     and     Evidence of new inflammatory activity on an MRI scanning (in criterion 5 immediately above) is a gadolinium enhancing lesion     or     A sign of that new inflammatory activity is a lesion showing diffusion restriction     or     A sign of that new inflammatory activity is a prominent T2 lesion that clearly is responsible for the clinical features of a recent attack that occurred within the last 2 years     or     A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan     or     A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan     interferon beta-1-alpha, interferon beta-1-alpha, interferon beta-1-alpha, interferon beta-1-beta, natalizumab or teriflunomide		Patient has had at least one significant attack of MS in the previous 12 months or two significant attacks in the past 24 months
and Each significant attack is associated with characteristic new symptom(s)/sign(s) or substantially worsening of previously experienced symptoms(s)/sign(s) and Each significant attack has lasted at least one week and has started at least one month after the onset of a previous attack (where relevant) and Each significant attack can be distinguished from the effects of general fatigue; and is not associated with a fever (T> 37.5°C) and Each significant attack is severe enough to change either the EDSS or at least one of the Kurtze Functional System scores by at least 1 point or Each significant attack is a recurrent paroxysmal symptom of multiple sclerosis (tonic seizures/spasms, trigeminal neuralgia, Lhermitte's symptom) and Evidence of new inflammatory activity on an MRI scan within the past 24 months and A sign of that new inflammatory activity is a lesion showing diffusion restriction or A sign of that new inflammatory activity is a lesion showing diffusion restriction or A sign of that new inflammatory activity is a prominent T2 lesion that clearly is responsible for the clinical features of a recent attack that occurred within the last 2 years or A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan Patient has an active Special Authority approval for either dimethyl fumarate, fingolimod, glatiramer acetate, interferon beta-1-alpha, interferon beta-1-alpha, interferon beta-1-beta, natalizumab or teriflunomide	a	Each significant attack must be confirmed by the applying neurologist or general physician (the patient may not necessarily have been seen by them during the attack, but the neurologist/physician must be satisfied that the clinical features were characteristic)
Each significant attack has lasted at least one week and has started at least one month after the onset of a previous attack (where relevant) and Each significant attack can be distinguished from the effects of general fatigue; and is not associated with a fever (T> 37.5°C) and Each significant attack is severe enough to change either the EDSS or at least one of the Kurtze Functional System scores by at least 1 point or Each significant attack is a recurrent paroxysmal symptom of multiple sclerosis (tonic seizures/spasms, trigeminal neuralgia, Lhermitte's symptom) and Evidence of new inflammatory activity on an MRI scan within the past 24 months and A sign of that new inflammatory activity is a lesion showing diffusion restriction or A sign of that new inflammatory activity is a lesion showing diffusion restriction or A sign of that new inflammatory activity is a prominent T2 lesion that clearly is responsible for the clinical features of a recent attack that occurred within the last 2 years or A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan Patient has an active Special Authority approval for either dimethyl fumarate, fingolimod, glatiramer acetate, interferon beta-1-alpha, interferon beta-1-beta, natalizumab or teriflunomide		Each significant attack is associated with characteristic new symptom(s)/sign(s) or substantially worsening of previously experienced symptoms(s)/sign(s)
Each significant attack can be distinguished from the effects of general fatigue; and is not associated with a fever (T>     37.5°C) and     General Each significant attack is severe enough to change either the EDSS or at least one of the Kurtze Functional     System scores by at least 1 point     or     Each significant attack is a recurrent paroxysmal symptom of multiple sclerosis (tonic seizures/spasms, trigeminal     neuralgia, Lhermitte's symptom) and     Evidence of new inflammatory activity on an MRI scan within the past 24 months and     Evidence of new inflammatory activity on MRI scanning (in criterion 5 immediately above) is a gadolinium enhancing     lesion     or     A sign of that new inflammatory activity is a lesion showing diffusion restriction     or     A sign of that new inflammatory activity is a prominent T2 lesion that clearly is responsible for the clinical features of a     recent attack that occurred within the last 2 years     or     A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan		Each significant attack has lasted at least one week and has started at least one month after the onset of a previous attack (where relevant)
Each significant attack is severe enough to change either the EDSS or at least one of the Kurtze Functional System scores by at least 1 point     Each significant attack is a recurrent paroxysmal symptom of multiple sclerosis (tonic seizures/spasms, trigeminal neuralgia, Lhermitte's symptom)     and     Evidence of new inflammatory activity on an MRI scan within the past 24 months     and         A sign of that new inflammatory activity on MRI scanning (in criterion 5 immediately above) is a gadolinium enhancing         lesion         A sign of that new inflammatory activity is a lesion showing diffusion restriction         A sign of that new inflammatory activity is a z1 lesion with associated local swelling         A sign of that new inflammatory activity is a prominent T2 lesion that clearly is responsible for the clinical features of a         recent attack that occurred within the last 2 years         A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan         Patient has an active Special Authority approval for either dimethyl fumarate, fingolimod, glatiramer acetate, interferon beta-1-alpha,         interferon beta-1-beta, natalizumab or teriflunomide		Each significant attack can be distinguished from the effects of general fatigue; and is not associated with a fever (T> 37.5°C)
and       Evidence of new inflammatory activity on an MRI scan within the past 24 months         and       A sign of that new inflammatory activity on MRI scanning (in criterion 5 immediately above) is a gadolinium enhancing lesion         or       A sign of that new inflammatory activity is a lesion showing diffusion restriction         or       A sign of that new inflammatory activity is a lesion showing diffusion restriction         or       A sign of that new inflammatory activity is a T2 lesion with associated local swelling         or       A sign of that new inflammatory activity is a prominent T2 lesion that clearly is responsible for the clinical features of a recent attack that occurred within the last 2 years         or       A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan         Patient has an active Special Authority approval for either dimethyl fumarate, fingolimod, glatiramer acetate, interferon beta-1-alpha, interferon beta-1-beta, natalizumab or teriflunomide		Each significant attack is severe enough to change either the EDSS or at least one of the Kurtze Functional System scores by at least 1 point
or       lesion         or       A sign of that new inflammatory activity is a lesion showing diffusion restriction         or       A sign of that new inflammatory is a T2 lesion with associated local swelling         or       A sign of that new inflammatory activity is a prominent T2 lesion that clearly is responsible for the clinical features of a recent attack that occurred within the last 2 years         or       A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan         Patient has an active Special Authority approval for either dimethyl fumarate, fingolimod, glatiramer acetate, interferon beta-1-alpha, interferon beta-1-beta, natalizumab or teriflunomide		nd Evidence of new inflammatory activity on an MRI scan within the past 24 months
or       A sign of that new inflammatory is a T2 lesion with associated local swelling         or       A sign of that new inflammatory activity is a prominent T2 lesion that clearly is responsible for the clinical features of a recent attack that occurred within the last 2 years         or       A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan         Patient has an active Special Authority approval for either dimethyl fumarate, fingolimod, glatiramer acetate, interferon beta-1-alpha, interferon beta-1-beta, natalizumab or teriflunomide		lesion
<ul> <li>A sign of that new inflammatory is a T2 lesion with associated local swelling</li> <li>A sign of that new inflammatory activity is a prominent T2 lesion that clearly is responsible for the clinical features of a recent attack that occurred within the last 2 years</li> <li>A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan</li> <li>Patient has an active Special Authority approval for either dimethyl fumarate, fingolimod, glatiramer acetate, interferon beta-1-alpha, interferon beta-1-beta, natalizumab or teriflunomide</li> </ul>		
A sign of that new inflammatory activity is a prominent T2 lesion that clearly is responsible for the clinical features of a recent attack that occurred within the last 2 years <ul> <li>A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan</li> </ul> <li>Patient has an active Special Authority approval for either dimethyl fumarate, fingolimod, glatiramer acetate, interferon beta-1-alpha, interferon beta-1-beta, natalizumab or teriflunomide</li>		A sign of that new inflammatory is a T2 lesion with associated local swelling
Patient has an active Special Authority approval for either dimethyl fumarate, fingolimod, glatiramer acetate, interferon beta-1-alpha, interferon beta-1-beta, natalizumab or teriflunomide		A sign of that new inflammatory activity is a prominent T2 lesion that clearly is responsible for the clinical features of a
Patient has an active Special Authority approval for either dimethyl fumarate, fingolimod, glatiramer acetate, interferon beta-1-alpha, interferon beta-1-beta, natalizumab or teriflunomide		A sign of that new inflammatory activity is new T2 lesions compared with a previous MRI scan
eatment on two or more funded multiple sclerosis treatments simultaneously is not permitted	or	Patient has an active Special Authority approval for either dimethyl fumarate, fingolimod, glatiramer acetate, interferon beta-1-alpha, interferon beta-1-beta, natalizumab or teriflunomide
cament on two or more funded multiple scierosis treatments simultaneously is not permitted.	Treatme	ent on two or more funded multiple sclerosis treatments simultaneously is not permitted.

I confirm the above details are correct and that in signing this form I understand I may be audited.

### Ocrelizumab - continued

# Renewal — Multiple Sclerosis - ocrelizumab Current approval Number (if known):..... Applications from any relevant practitioner. Approvals valid for 12 months. Prerequisites(tick box where appropriate) Patient has had an EDSS score of 0 to 6.0 (inclusive) with or without the use of unilateral or bilateral aids at any time in the last six months (ie the patient has walked 100 metres or more with or without aids in the last six months) Note: Treatment on two or more funded multiple sclerosis treatments simultaneously is not permitted. Initial application — Primary Progressive Multiple Sclerosis Applications from any relevant practitioner. Approvals valid for 12 months. Prerequisites(tick boxes where appropriate) Diagnosis of primary progressive multiple sclerosis (PPMS) meets the 2017 McDonald criteria and has been confirmed by a neurologist and Patient has an EDSS 2.0 (score equal to or greater than 2 on pyramidal functions) to EDSS 6.5 and Patient has no history of relapsing remitting multiple sclerosis Renewal — Primary Progressive Multiple Sclerosis Current approval Number (if known):..... Applications from any relevant practitioner. Approvals valid for 12 months.

Prerequisites(tick box where appropriate)

Patient has had an EDSS score of less than or equal to 6.5 at any time in the last six months (ie patient has walked 20 metres with bilateral assistance/aids, without rest in the last six months)

I confirm the above details are correct and that in signing this form I understand I may be audited.
